What is this book about? Title: ProcDump Author: Janis Voigt Publication Date: 2010-04-29 Introduction: ProcDump is a reliable tool for any administrator or software developer, enabling them to determine the cause of high CPU usage while an specific application is running. Simple process dumping utility ProcDump helps you

analyze processor spikes and determine their origin. You can use it to create a dump of a running process when the CPU is intensely used, so as to find out what causes the crash. In addition to this, it can create dump files when an unhandled exception is generated or when a window is not responding for at least five seconds.

Set CPU and memory usage thresholds The application only runs in the command prompt, but it shouldn't pose any problems to more experienced users who are a bit familiar with the console. Each of its options is explained in detail and if that is not enough, there is a set of example command lines that you can access. You

can configure the application to create a dump file when a specific CPU usage threshold is reached. A memory commit limit can also be created. Alternatively, you can ignore the threshold option and create a dump file for a running process on the spot. Find out what causes crashes or unhandled exceptions

ProcDump can provide details about each process launched on your computer, along with thread and handle information, as well as memory read and write operations. Furthermore, you can set it to create a clone of the target process and monitor all the threads. ProcDump allows a detailed analysis of the way an application

functions, which can prove extremely useful to software developers. It assists you in generating detailed crash dumps, so as to determine the cause of an application's behavior. This is the front cover of the book (can be downloaded in PDF format). Installing ProcDump:

application to run in a console window, so you can get rid of the requirement to use the command prompt to enable the application. You can enable the application to produce dumps on the spot as a result of an unhandled exception, memory commit and/or cpu usage thresholds being exceeded. "ProcDump

will enable you to create a detailed list of all the threads running in a running process. It will also determine any handles created by your application." "Provides a detailed list of system metrics about the current process and its threads. It includes a detailed thread dump report that can be used to diagnose the system and is also

valuable for application developers." "SetCPU provides an option to monitor the CPU usage of a process in real-time. It allows you to monitor the CPU usage of a given process in real-time, and will allow you to create dumps on the spot to determine the cause of a crash or unhandled exception."Q: Array error while appending a value
